(54) Title: METHOD AND SYSTEM FOR SELECTING PRODUCT COLORS

(57) Abstract: An exemplary embodiment of the invention is a method for selecting a color of a product using a potential purchaser computer coupled to a host computer system over a network. The method includes receiving a request at the host computer system from the potential purchaser computer to order a product in a first color. The host computer system searches a database to determine if the ordered product in the first color is in stock or out of stock. The potential purchaser computer is notified that the product in the first color is an out of stock product. A database of in stock products is searched for in stock products having an in stock color close to the first color. The potential purchaser computer is notified of the results of the search.

METHOD AND SYSTEM FOR SELECTING PRODUCT COLORS

BACKGROUND OF THE INVENTION

The present invention relates to color and, more specifically, to the selection of a color for a product.

Many products are offered in a number of colors. For instance, paints and plastics are offered in numerous colors. Potential purchasers of products that come in a number of different colors are either: (1) looking for the product in a specific color; or (2) want to browse the available colors for the product. Presently, a potential purchaser that is looking for a product in a specific color has three options for determining whether the product is available in the desired color. The first option requires the potential purchaser to send a sample of the desired color to the vendor. The vendor then performs a search of its color library to determine whether or not the product is available in the desired color and then informs the potential purchaser of the results of the search. The second option is for the potential purchaser to travel to the vendor's site and review their color library for a product to determine whether or not the vendor offers the product in the desired color. Lastly, the potential purchaser can request a physical copy of the vendor's color catalog for the product and search the catalog for the specific color. Due to printing costs and the like, physical copies of the vendor's catalog are, in many instances, out of date. In any case, the vendor may offer the product in a color that, while not the desired color, is close enough. Alternatively, if the product is not available in the desired color or a color that is close enough for the purchaser, some vendors offer to match the color. Matching a color is generally a time consuming and expensive endeavor. A purchaser that wants to browse the available colors for a product either travels to the vendor's site to peruse the vendor's color library for a product or obtains a copy of the vendor's color catalog for the product to review.

BRIEF SUMMARY OF THE INVENTION

An exemplary embodiment of the invention is a method for selecting a color of a product using a purchaser system coupled to a host system over a network. The method includes receiving a request at the host system from the purchaser system to order a product in a first color. The host system searches a database to determine if the ordered product in the first color is in stock or out of stock. The purchaser system is notified that the product in the first color is an out of stock product. A database of in stock products is searched for in stock products having an in stock color close to the first color. The purchaser system is notified of the results of the search.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 is a diagram of a system capable of communicating information relating to the available colors for a product to a potential purchaser;

Fig. 2 shows one possible interface display on a potential purchaser's color monitor for permitting the potential purchaser to input a target color description to be used in the search mode of operation;

Fig. 3 shows one possible display on a potential purchaser's color monitor of an options menu that permits the potential purchaser to configure the viewing options, such as selecting the background color to be used in the "virtual color table" shown in Fig. 2;

Fig. 4 shows one possible display on a potential purchaser's color monitor of a form for ordering samples of colors of a product;

Fig. 5 shows one possible interface display on a potential purchaser's color monitor for permitting the potential purchaser to browse a color database for a product;

Fig. 6 shows one possible display on a potential purchaser's monitor for comparing color values;

Fig. 7 shows one possible display on a potential purchaser's monitor for viewing statistical information;

Fig. 8 shows one possible display on a potential purchaser's monitor of a color region derived from statistical information; and

5 Fig. 9 shows one possible display on a potential purchaser's monitor of two color regions derived from statistical information.

DETAILED DESCRIPTION OF THE INVENTION

Fig. 1 illustrates a system 10 for providing color related information on a product to a potential purchaser of the product. The system 10 includes: (1) a digital communication network 12 for conveying digital information between at least
10 two locations; (2) a host computer system 14 that includes a color database 16 for a product and is capable of providing color related information for transmission over the network 12; and (3) one or more potential purchaser computers 18A-18N that are each capable of generating requests relating to a color database for transmission over the network 12 and receiving replies from the host computer system 14 that have also
15 been transmitted over the network 12.

In Fig. 1, the network 12 may be the Internet and, more specifically, the World Wide Web portion of the Internet. Due to the use of the World Wide Web as the network 12, the potential purchaser computers 18A-18N and the host computer system 14 are each capable of communicating over the Web. In this regard, the
20 potential purchaser computers 18A-18N are each devices that are capable of running a Web browser to communicate over the Web. For example, a potential purchaser's computer can be a personal computer or a Web TV. The host computer system 14 utilizes a Web server 20 to communicate with the potential customer computers 18A-18N. Even though the system 10 utilizes the Web as the network 12 for conveying
25 communications between the host computer system 14 and the potential purchaser computers 18A-18N, it should be appreciated that the invention is capable of being adapted for use in other types of systems.

The host computer system 14 provides each of the potential purchaser computers with an interface that permits the potential purchaser to interact with the host computer system 14 via their computer. The interface includes an output portion and an input portion. The output portion conveys information from the host computer system 14 to a potential purchaser's computer and is typically displayed on the color monitor of the potential purchaser's computer. However, the output portion could be displayed on any output peripheral that is capable of generating colors. The input portion of the interface is used to convey information from the potential purchaser's computer to the host computer system 14. Typically, the input information is generated by the potential purchaser's use of an input peripheral, such as a mouse or keyboard. In the illustrated embodiment, the interface is provided by Web pages that are transmitted from the host computer system 14 to a potential purchaser's computer. The Web pages display output information to the potential purchaser. In most cases, a portion of the display is used to solicit information from the potential purchaser by manipulating an input peripheral. For example, the potential purchaser may use their keyboard to input information into a field in the display or their mouse to click on a portion of the display, and thereby provide the host computer system 14 with information.

The interface provided to the potential purchaser's computer relates to either a search mode or a browse mode of operation. The search mode of operation permits a potential purchaser that knows the color that they desire for a particular product to determine if the vendor either has the product in the target color or a color that is close enough to the target color. The browse mode of operation permits a potential purchaser who is uncertain of what color they want for a particular product to browse the available colors for the product.

Regardless of the mode of operation, in many cases the vendor offers more than one product and each product is available in more than one color. For instance, a plastics vendor, could offer polycarbonate, ABS and polypropylene plastics, with each being available in a number of different colors. Consequently, in this case, the interface provided by the host computer system 14 to the potential purchaser's computer requires the potential customer to initially identify the product

in which they are interested so that the host computer system 14 can access the appropriate color database. Fig. 2 illustrates one possible Web page that could be displayed on the monitor of a potential purchaser's computer and used by the potential purchaser to select the product of interest. The Web page includes a menu of products field 32 that permits the potential purchaser to select the product of interest. Typically, the potential purchaser uses a mouse to make the selection. However, it is also feasible to use other input devices to make a selection. In any event, once the selection has been made, the product selection information is conveyed over the network 12 to the host computer system 14.

In the search mode of operation, the potential purchaser specifies a target color for the product. The target color can be specified in a number of different ways. One way is the RGB method, which involves specifying a value for the red, green and blue components of the target color. Presently, values from 0-256 can be specified for each component. Another way to specify a color is by the L*a*b* method. In this case, values are specified for the "L*", "a*" and "b*" components of the target color. The "L*" component is the lightness/darkness of the target color; the "a*" component relates to the red/green aspect of the target color; and the "b*" component relates to the yellow/blue aspect of the target color. Presently, the "L*" component can have a value from 0 to 10, the "a*" component can have a value from -199 to +199; and the "b*" component can have a value from -199 to +199. Yet another way to specify a color is for the purchaser to select a color from a color display, either one or two dimensional, comprised of a number of color swatches. Associated with each tile is either a RGB or L*a*b* code.

To specify the target color, the potential purchaser's computer is provided with an interface that permits the potential purchaser to identify the target color. In the illustrated embodiment, the interface is a Web page that is provided by the host computer, conveyed over the network 12 and displayed on the monitor or other output device of the potential purchaser's computer. Fig. 2 illustrates one possible Web page that could be displayed on the monitor of a potential purchaser's computer and used by the potential purchaser to input target color information to the host computer system 14. The potential purchaser is permitted to specify which color

definition (RGB, L*a*b* or color display) is to be used in color space field 34. If either RGB or L*a*b* color definition scheme is selected, the potential purchaser specifies the value for each component of the target color in the target color values field 36. If the potential purchaser selects the color display, the target color is selected from a color display 38. To elaborate, the potential purchaser positions a bar 40 within a lightness field 42 to define the brightness of the target color. The purchaser inputs or selects the hue of the target color from the color palette field 44 using a mouse or other appropriate input device. The potential purchaser may also change only the products field 32 after specifying a target color to view other products having similar target colors. In any event, once the brightness and hue of the target color have been specified, the target color information is conveyed over the network 12 to the host computer system 14.

Once the host computer system 14 has received the target color information, a search of the color database 16 of available colors for the product commences. To facilitate the search of the database of available colors for a product, the search is conducted according to a single color identification system. In this case, the search initially may involve converting the target color data from one color identification system into the color identification system used in performing the search. In the illustrated embodiment, the search is conducted based on the L*a*b* system. Consequently, if the target color is specified according to the RGB system, it is converted to the L*a*b* system. This conversion is done according to a well known formula used in the television industry. After any conversion, the host computer system 14 operates to determine the "n" number of available colors for the product that are closest to the target color. In the illustrated embodiment, the number "n" is nine. However, this number can be changed if desired.

The determination of the "n" closest available colors is done by associating a tolerance with each of the values of the target color. For instance, the tolerance may be ± 10 units. In essence, this defines a three dimensional space of color values. A search is then conducted of the database of available colors for the product for all the available colors that fall within the defined space. If the search identifies a number of available colors that exceeds the "n" value, the tolerance is

halved to define a smaller three-dimensional space and the search is repeated. If a search identifies a number of available colors that is less than the "n" value, the tolerance is doubled to define a larger three-dimensional space and the search is repeated. Typically, the number "n" will be greater than the numbers of available colors identified in a search having first tolerance and less than the number of available colors identified in a search having a second tolerance that is twice the first tolerance, i.e. the next higher tolerance level. In this case, the "n" closest available colors from the search that produced "n" or more available colors are provided to the potential purchaser. While the search is shown as being conducted using the L*a*b* format, the search is capable of being adapted to the RGB format or any other multidimensional format for defining a color.

For each of the available colors that the host computer system 14 identifies as being closest to the target color, the host computer system 14 also determines the "closeness" of the available color to the target color. In the illustrated embodiment, the closeness (e) of an available color to the target color is determined by: (1) determining the differences (dL*, da* and db*) between the "L*", "a*" and "b*" components of the available color and the corresponding "L*", "a*" and "b*" components of the target color; (2) squaring the differences; and (3) summing the squares; and (4) taking the square root of the sums. This method of determining "closeness" is adaptable to the RGB format and any other multidimensional format for defining a color.

Once the host computer system 14 has identified the available colors that are closest to the target color and the closeness of each of each of the available colors to the target color, this information is conveyed over the network 12 to the potential purchaser's computer for display on the color monitor or other output device associated with the potential purchaser's computer. Typically, the information is conveyed in RGB format, which is color format used by most computers. In the illustrated embodiment, the information is conveyed in the form of a Web page that is displayed on the color monitor of the potential purchaser's computer that is running a browser. The information is displayed as a "virtual color table" in which the default background color is the target color and the "n" closest available colors are swatches

or tiles overlying the background color. The interface permits the potential purchaser to move or "drag" swatches around on the virtual color table. Fig. 2 includes an example of a virtual color table 46. Associated with each swatch in the virtual color table 46 is the closeness value calculated by the host computer. In Fig. 2, the closeness of a particular swatch to the target color is displayed in closeness field 48. The potential purchaser uses their mouse or other input device to pick the swatch in the virtual color table 46 for which they want a closeness value to be displayed in the field 48. Further, if needed, a vendor identification number can also be associated with each swatch. The interface also permits the potential purchaser to define a different background color. Fig. 3 illustrates an options Web page that permits the potential purchaser to define the background in a table background field 50.

At this point, the interface permits the potential purchaser to identify one or more of the available colors identified in the search as colors for which the potential purchaser would like actual samples to inspect. In the illustrated system, the potential purchaser uses a mouse or other input device to identify or "click on" the available color for which samples are desired. The color is typically identified by its vendor number. However, it is feasible to use a RGB, L*a*b* or other color identification number as the vendor number or translate such a number into a vendor number. In any event, this information is conveyed over the network 12 to the host computer system 14. In response, the host computer system 14 communicates the sample order to the appropriate individuals for processing. Fig. 4 illustrates an order Web page that permits the potential purchaser to order actual samples of the colors in an order list field 52. The colors in the order list field 52 are defined by using a mouse or other input device to: (1) identify a particular color in the virtual color table 46; and (2) then actuate an add to order button 49. As an alternative, or in addition to ordering samples, the interface permits the potential purchaser to also place an order for a quantity of product in an available color that either matches the target color or, based upon the potential purchaser's judgment, is close enough to the desired color.

The browse mode of operation permits a potential purchaser who is uncertain about the color that they want for a particular product to peruse the available colors for the product. If there are only a few available colors for a product,

a one dimensional array of the available colors is conveyed from the host computer system 14 to the potential purchasers computer system over the network 12. The array is displayed on the potential purchaser's color monitor or other output device. In many cases, the number of available colors for a particular product is greater than
5 can be meaningfully displayed in a single image on the potential purchaser's color monitor or other output device. In this situation, the potential purchaser is provided with an interface that includes an indexing tool. The indexing tool is a spectrum of colors that is transmitted from the host computer system 14 to the potential purchasers computer system for display on a color monitor. The potential purchaser is able to
10 move a bar or other indicator within the spectrum by manipulating an input device, typically a mouse. The location of the bar relative to the displayed spectrum is conveyed over the network 12 to the host computer system 14. The location of the bar defines a color definition, such as a RGB or L*a*b* color definition. In response, the host computer system 14 determines which of the available colors are within a
15 certain tolerance of the defined color, much like the previously described search operation, and transmits swatches of the available colors over the network 12 to the potential purchaser's computer for display on a color monitor or other output device.

Fig. 5 illustrates one possible Web page that could be displayed on the potential purchaser's computer in a browse mode. The spectrum is one dimensional
20 array and is displayed in a window 26 on the potential purchaser's color monitor. A bar 28 is located adjacent to the window 26 and can be moved back and forth along the length of the spectrum. The available colors for the product that are closest to the color in the spectrum indexed by the bar 28 are displayed in a one dimensional array in another window 30 on the potential purchaser's color monitor. Colors that are
25 selected from the window 30 are displayed in a virtual color table 54 that is identical to the virtual color table 46 shown in Fig. 2. The Web page interface operates such that as the potential purchaser changes the position of the bar 28 relative to the spectrum in the first window 26, the host computer system 14 changes the available colors in the second window 30. Further, if a search was conducted before the browse
30 mode was entered, the browse mode initially positions the bar at a point on the

spectrum that roughly corresponds to the target color defined in the prior search mode.

At this point, the potential purchaser can select one or more of the colors from the virtual color table 54 as colors for which they would like to obtain actual samples to inspect. The ordering of samples proceeds in substantially the same manner as described with respect to the search mode.

The host computer system 14, in the illustrated embodiment, includes an order database 35, access control database 37, database server 39 and firewall 41. The database server processes requests relating to either the color database 16, order database 35 or access control database 37. The order database 35 is used to store sample orders made by a potential purchaser and/or product orders. The access control database 37 operates in conjunction with the firewall 41 to: (1) prevent unauthorized access to the host computer system 14; and (2) with respect to individuals/companies that are authorized access to the host computer system 14, enforce any limitations on the authorized access. For instance, a system administrator typically may have access to the entire system. Whereas, a potential purchaser would have their access limited to reading information from the color database 16 and placing orders for either samples or product.

As described above with respect to Fig. 4, the potential purchaser can order product or samples of product from the host computer system 14. There are, however, situations where the ordered product is not in readily available (i.e., the ordered product is not in stock). In that situation, the potential purchaser computer may be presented with a user interface such as that shown in Fig. 6. As shown in Fig. 6, the potential purchaser is notified that the item ordered is out of stock. The order database 35, or a separate database, includes data concerning whether a product is in stock. If an ordered product is out of stock, the potential purchaser is notified as shown in Fig. 6. In this situation, the host computer system 14 provides to the potential purchaser computer a virtual color table 60 as shown in Fig. 6. In virtual color table 60, the background 62 is set to the color of the ordered product which is out of stock. The foreground swatches 64 are displayed as in stock colors close to the

ordered color. The host computer system 14 determines the n (e.g., nine) closest colors as described above and then determines if the nine colors are in stock. Only colors that are in stock are displayed in color table 60. Accordingly, based on product availability, less than nine colors may be displayed as foreground swatches 64.

5 Alternatively, host computer system 14 may search for nine available (i.e., in stock) colors closest to the out of stock ordered color and display the nine in stock colors.

In addition to the graphical display of color difference through color table 60, the potential purchaser can access the numerical difference between the ordered out of stock color and an in stock color. The potential purchaser can use a

10 mouse or other input device to pick the swatch 64 in the virtual color table 60 for which they want a difference value. An ordered color field 66 provides the color of the ordered out of stock color in numerical terms such as L^* , a^* , b^* values. An available color field 67 provides the color values for the color swatch 64 selected from the color table 60. A color difference field 68 provides the difference in color

15 values as dL^* , da^* , and db^* . In addition, a closeness value dE is provided as described above. The potential purchaser can select swatches 64 and view the closeness for each of the available colors.

In order to assist the potential purchaser in interpreting the color difference values dL^* , da^* and db^* and the closeness value dE , statistical data may be

20 provided to the potential purchaser computer as shown in Fig. 7. The potential purchaser can access statistical data by selecting the statistics icon 72 in Fig. 6 using a mouse or other input peripheral. As shown in Fig. 7, the host computer system 14 provides the low, high, average and standard deviation for the color values for the ordered out of stock product. The statistical information may be stored in a memory

25 device accessible by the host computer system 14. The statistical information can assist the potential purchaser in selecting an appropriate in stock color. For example, if the L^* value for the ordered out of stock color normally varies widely, then the potential purchaser may not consider dL^* as important as da^* and db^* when selecting an in stock color.

To assist the potential purchaser, the statistical information may be presented to the potential purchaser computer in a graphical format in a three dimensional color space 90 as shown in Fig. 8. Fig. 8 depicts an L^* , a^* , b^* color space 90 in which the ordered out of stock color is shown. The variance in the L^* , a^* and b^* values results in a three dimensional color region 94. A three dimensional color region 94 may be generated through interpolation and/or approximation to produce a shape which fits the low and high values for L^* , a^* and b^* values. In the example shown in Fig. 8, the color region 94 appears cylindrical due to the fact that the L^* value varies more than the a^* and b^* values. The color table 60 described above with reference to Fig. 6 may be presented to the potential purchaser computer along with the color space 90 in Fig. 8. The potential purchaser can select the in stock colors from swatches 64. The color regions corresponding to the in stock colors may be displayed in the color space 90 using statistical information related to the an stock color. This allows the potential purchaser to view closeness of the color regions between the out of stock color and in stock colors.

Using the statistical information, a different closeness calculation may be used. As described above, the closeness value dE is determined based on points in color space. Using the statistical information, each color represents a region in color space. Accordingly, the closeness value can be determined by computing the minimum distance between color regions. This feature is illustrated in Fig. 9 which depicts a color region 100 for an out of stock ordered color and a color region 102 for an in stock color. If the average color values were used in a point to point closeness determination, the closeness value X would result. To determine the closest distance between the regions 100 and 102, the host computer system 14 may determine a closeness value dE for each point in the out of stock color region and the in stock color region and select a minimum dE from all the closeness values. As shown in Fig. 9, this results in a closeness value of Y , which is smaller than X and indicates a better match. Thus, use of statistical data can improve the accuracy of the determination of the closeness value.

The program run by the host computer system 14 to provide the interface and process requests from the potential purchaser's computer may be written

in HTML and JAVA so that it is platform independent. Queries of the databases are done in SQL. Other programs run by the host computer system provide for system administration, maintenance and the uploading of color information into the color database. The color information that is to be uploaded can reside in an off-site color database that is accessible via the network.

As described above, the invention can be embodied in the form of computer-implemented processes and apparatuses for practicing those processes. The invention can also be embodied in the form of computer program code containing instructions embodied in tangible media, such as floppy diskettes, CD-ROMs, hard drives, or any other computer-readable storage medium, wherein, when the computer program code is loaded into and executed by a computer, the computer becomes an apparatus for practicing the invention. The invention can also be embodied in the form of computer program code, for example, whether stored in a storage medium, loaded into and/or executed by a computer, or transmitted over some transmission medium, such as over electrical wiring or cabling, through fiber optics, or via electromagnetic radiation, wherein, when the computer program code is loaded into and executed by a computer, the computer becomes an apparatus for practicing the invention. When implemented on a general-purpose microprocessor, the computer program code segments configure the microprocessor to create specific logic circuits.

While the invention has been described with reference to exemplary embodiments, it will be understood by those skilled in the art that various changes may be made and equivalents may be substituted for elements thereof without departing from the scope of the invention. In addition, many modifications may be made to adapt a particular situation or material to the teachings of the invention without departing from the essential scope thereof. Therefore, it is intended that the invention not be limited to the particular embodiments disclosed for carrying out this invention, but that the invention will include all embodiments falling within the scope of the appended claims.

WHAT IS CLAIMED IS:

1. A method for selecting a color of a product using a potential purchaser computer coupled to a host computer system over a network, the method comprising:

5 receiving a request at the host computer system from the potential purchaser computer to order a product in a first color;

the host computer system searching a database to determine if the ordered product in the first color is in stock or out-of stock;

notifying the potential purchaser computer that said product in the first color is an out of stock product;

10 the host computer system searching for in stock products having an in stock color close to the first color; and

notifying the potential purchaser computer of the results of said searching.

2. The method of claim 1 further comprising:

15 providing statistical information related to the first color to the potential purchaser computer.

3. The method of claim 2 wherein:

said statistical information is presented as a first color region in a color space.

4. The method of claim 2 further comprising:

providing statistical information related to the in stock color.

5. The method of claim 4 wherein:

5 said statistical information related to the in stock color is presented as
an in stock color region in a color space.

6. The method of claim 3 further comprising:

providing statistical information related to the in stock color.

7. The method of claim 6 wherein:

10 said statistical information related to the in stock color is presented as
an in stock color region in the color space.

8. The method of claim 7 wherein:

15 said searching the database of in stock products for in stock products
having an in stock color close to the first color includes computing a closeness value,
said closeness value representing the minimum distance between said first color
region and said in stock color region.

9. A system for selecting a color of a product, the system comprising:

a potential purchaser computer for generating a request to order a product in a first color;

5 a host computer system coupled to the potential purchaser computer over a network for receiving the request from the potential purchaser computer;

the host computer system searching a database to determine if the ordered product in the first color is in stock or out-of stock;

the host computer system notifying the potential purchaser computer that said product in the first color is an out of stock product;

10 the host computer system searching for in stock products having an in stock color close to the first color; and

the host computer system notifying the potential purchaser computer of the results of said searching.

10. The system of claim 9 wherein:

15 the host computer system provides statistical information related to the first color to the potential purchaser computer.

11. The system of claim 10 wherein:

said statistical information is presented as a first color region in a color space.

12. The system of claim 10 wherein:

the host computer provides statistical information related to the in stock color.

13. The system of claim 12 wherein:

5 said statistical information related to the in stock color is presented as an in stock color region in a color space.

14. The system of claim 11 wherein:

the host computer system provides statistical information related to the in stock color.

10 15. The system of claim 14 wherein:

 said statistical information related to the in stock color is presented as an in stock color region in the color space.

16. The system of claim 15 wherein:

 said searching the database of in stock products for in stock products
15 having an in stock color close to the first color includes computing a closeness value, said closeness value representing the minimum distance between said first color region and said in stock color region.

17. A storage medium encoded with machine-readable computer program code for selecting a color of a product using a potential purchaser computer coupled to a host computer system over a network, the storage medium including instructions for causing the host computer system to implement a method comprising:

5 receiving a request from the potential purchaser computer to order a product in a first color;

 searching a database to determine if the ordered product in the first color is in stock or out-of stock;

10 notifying the potential purchaser computer that said product in the first color is an out of stock product;

 searching for in stock products having an in stock color close to the first color; and

 notifying the potential purchaser computer of the results of said searching.

15 18. The storage medium of claim 17 further comprising instructions for causing the host computer system to implement:

 providing statistical information related to the first color to the potential purchaser computer.

 19. The storage medium of claim 18 wherein:

20 said statistical information is presented as a first color region in a color space.

20. The storage medium of claim 18 further comprising instructions for causing the host computer system to implement:

providing statistical information related to the in stock color.

21. The storage medium of claim 19 wherein:

5 said statistical information related to the in stock color is presented as an in stock color region in a color space.

22. The storage medium of claim 19 further comprising instructions for causing the host computer system to implement:

providing statistical information related to the in stock color.

10 23. The storage medium of claim 22 wherein:

 said statistical information related to the in stock color is presented as an in stock color region in the color space.

24. The storage medium of claim 23 wherein:

15 said searching the database of in stock products for in stock products having an in stock color close to the first color includes computing a closeness value, said closeness value representing the minimum distance between said first color region and said in stock color region.
